

Code Documentation - Simple Menu & Audio System

Custom Level Loader C# Script

This script allows you to load a custom level publicly within the Unity “Inspector” panel. This script can be used for multiple buttons in different scenes. This script plays a sound on click of a designated button (in connection with Unity’s “On Click” system), and enables a loading screen with a progress bar and text. The “Load Delay Time” can be changed publicly to allow a shorter or longer loading time.

Features

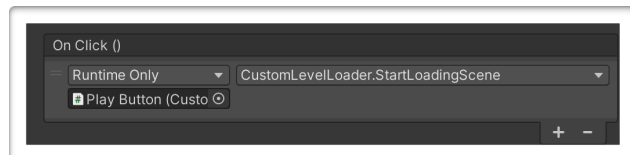

1. Custom Scene Loading by Scene Name
2. Custom Scene Load Delay Time
3. Loading Screen with Progress Bar & Text (Customizable)
4. Custom Audio Playback on Click

UI Animation Enabler C# Script

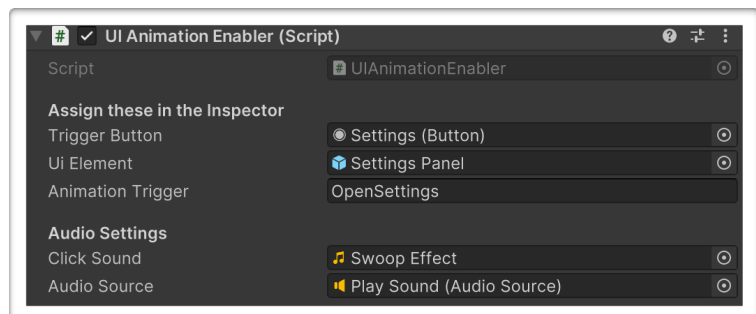

This script is for the **Settings Button** and pops up the settings panel that comes with this asset. On click, it plays a custom sound of your choice and plays an animation that brings the settings panel into view. This script also has a customizable Trigger that works with Unity’s Animator Window. This trigger enables the animation to switch from a default state to an animated state.

(This script works in conjunction with Unity’s “On Click” button system)

Features

1. Custom Trigger Button
2. Custom UI Element (Comes with a pre-built Settings Panel)
3. Animation Trigger (Customizable)
4. Button Click Audio (Customizable)

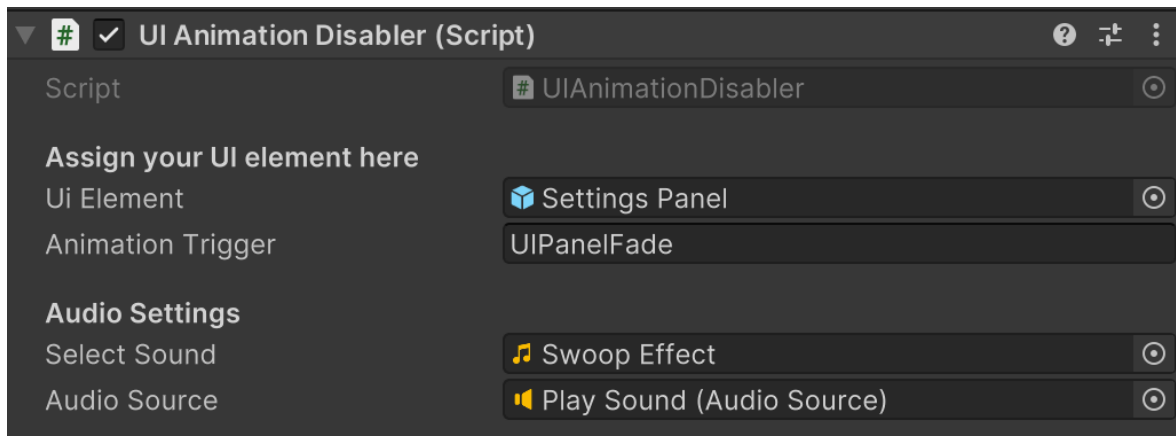

Code Documentation - Simple Menu & Audio System

UI Animation Disabler C# Script

This script is for the **Back Button** on the settings panel. When pressed it plays a sound and an animation that sends the settings panel off to the side of the screen where it can't be seen. This script, like the "UI Animation Enabler" script, also has a customizable Trigger that works with Unity's Animator Window. This trigger enables the animation to switch from the "appeared state" to the "Fade" state, where the animation moves the settings panel off screen.

Features

1. Custom Trigger Button (Via Unity's "On Click" feature)
2. Custom UI Element (Comes with a pre-built Settings Panel)
3. Animation Trigger (Customizable)
4. Button Click Audio (Customizable)

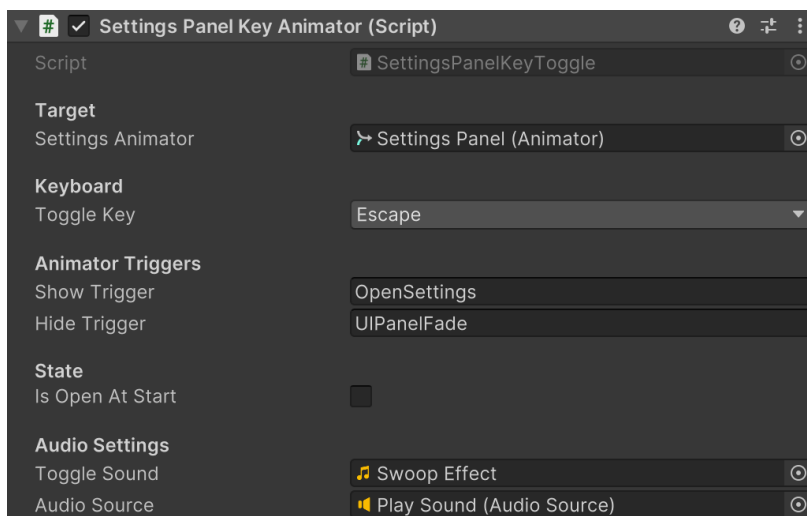

Settings Panel Key Toggle C# Script

This script does everything that the **UI Animation Enabler & Disabler** scripts do, all in one script. Except this script works with a toggle key of your choice. By default, the **ESC** key is the key you toggle to make the Settings panel appear and disappear, but this can be set to ANY key!

Features

1. Custom Settings Panel (Requires the panel have an Animator attached)
2. Custom Key Toggle (Can be switched to any key)
3. Custom Show/Hide Triggers
4. Audio Play Sound (Customizable)
5. Toggle for Active state of the UI Panel on start (Turned off by default)

SFX Mixer Slider Control / Music Mixer Slider Control C# Script

These scripts are the same, just one dedicated for SFX and the other for Music. The scripts control the volume for their sound type. When connected to an in game slider, the sounds they are connected to can be controlled in game. Once the mixers are connected to all audio sources, all in game music (or SFX) volume can be controlled by the slider in the settings panel!

This script connects to the Mixer via an “Exposed Parameter.” This variable can be changed in the inspector, but is set to “SFX Control Variable” or “Music Control Variable” by default. Changing this will break the script unless you also change the Exposed Parameters name on the audio mixer too.

How to Use:

To use, add the mixer of choice to the Output on the Audio source that you want. For music add the Music Mixer and for SFX add the SFX Mixer.

Features

1. Publicly Assignable Audio Mixer (Can be Custom)
2. Mixer Exposed Parameter Variable (Can be changed for your own custom mixer **make sure to change the parameter on the mixer as well**)
3. Publicly assignable slider (Comes with pre-built slider by default)
4. Customizable Minimum and Maximum *Slider Range Settings*.
